

***Carex x deserta* Merino** (*C. laevigata x binervis*)

Native

GB: Vulnerable

VC5 Rare; VC6 Absent

A rare hybrid sedge first found in Britain in 1961 by Arthur Chater, on a damp roadside slope near Llyn Du, north of Tremadog, Caernarfonshire, and re-found nearby in 2009 (Jones, 2010). The only other known sites are in Somerset. In VC5 first found in 1998, growing with both parents in a wet flush on Dunkery Hill, Exmoor (Stace *et al.*, 2015). In 2010, Jeanne Webb found this hybrid at a second location nearby, at Holt Ball, near Luccombe. With a new location discovered near each of the original sites, this hybrid may be increasing in Britain and in Somerset, although it may have been overlooked in the past.

VC5

Dunkery Hill	SSSI	SS90114258	2010	RSC	Increased since first found
Dunkery Hill	SSSI	SS90124258	2010	RSC	Increased since first found
Dunkery Hill	SSSI	SS901425	2011	FJR	Dense patch, bottom of flush with mainly <i>C. binervis</i>
Holt Ball	SSSI	SS91874377	2010	JW
